#### Energy Technology Perspectives 2014

Energy Technology Perspectives 2014: Harnessing Electricity's Potential

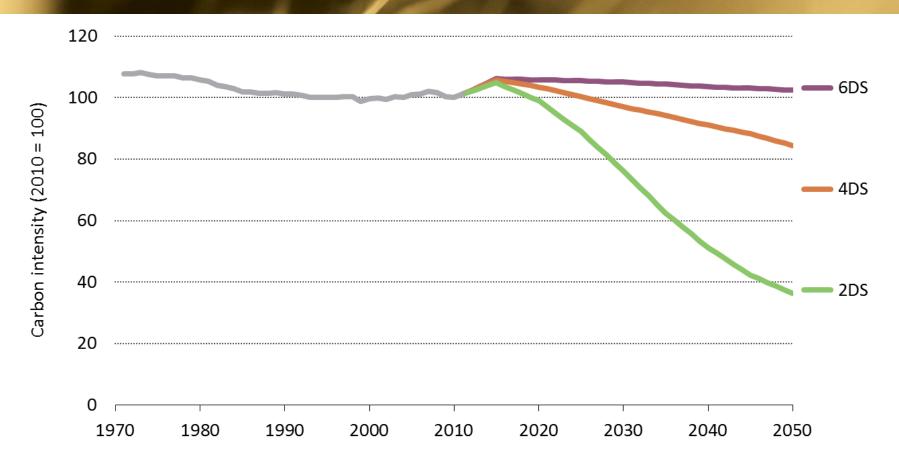

Didier Houssin Director, Sustainable Energy Policy and Technology International Energy Agency

Paris, France 30 June 2014

#### ETP 2014

#### Carbon Intensity of supply is stuck

The political will to make meaningful progress at a global scale has yet to be demonstrated

**ie**a

#### A transformation is needed...

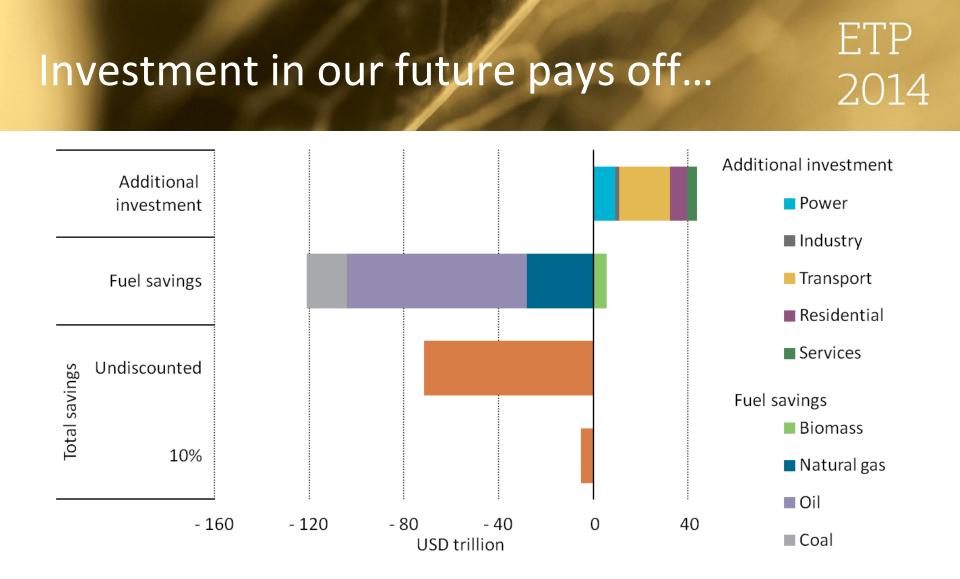

# ..and we to have the tools to develop a strategy and be proactive.

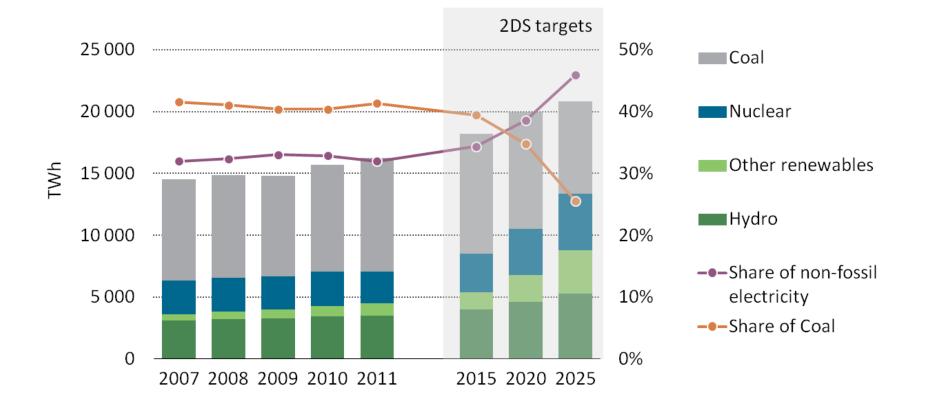

Internationa

...and it is cost effective to make the transition

### Going in the wrong direction globally

Unabated coal use in electricity generation is incompatible with 2DS objectives

#### We are not on track

### Harnessing Electricity's Potential

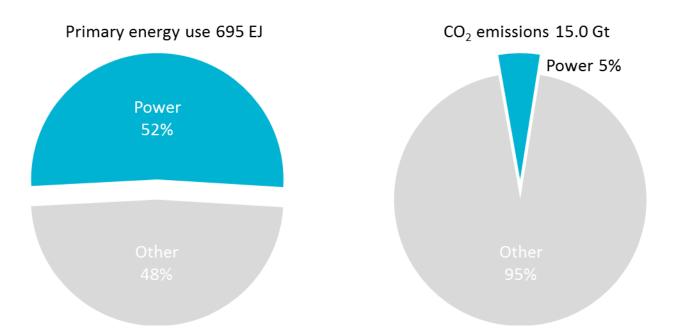

Increasing electricity consumption and share of overall energy usage– for **ALL** forward looking scenarios

2014

© OECD/IEA 2013

# Electricity dominates the energy system

2050 2DS

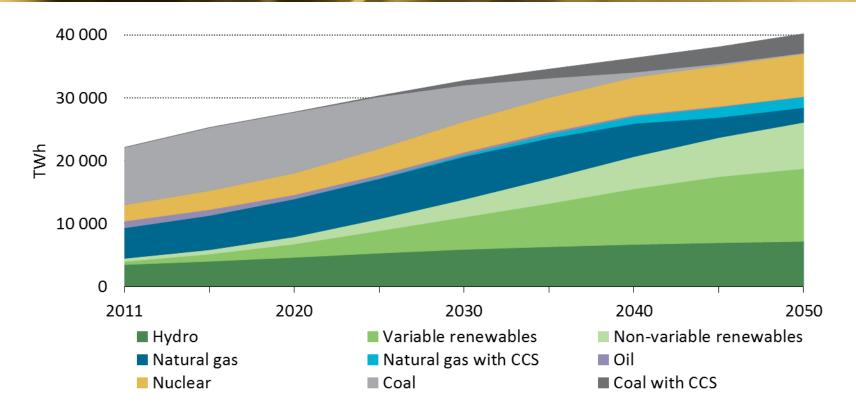

The 2DS pathway disconnects primary energy used in generation from emissions

2.014

# Electricity Generation: a share reversal

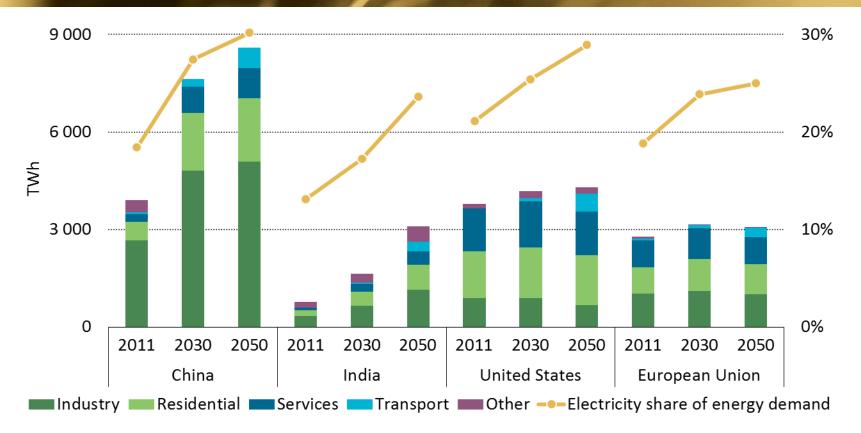

- Generation today:
  - Fossil fuels: 68%
  - Renewables: 20%

- Generation 2DS 2050:
  - Renewables: 65%
  - Fossil fuels: 20%

- -

# Understanding the regional context in the 2DS

Differences in growth of *electricity* demand and sectoral distribution require targeted systems development plans. All regions show high growth in VRE deployment

lea

#### We have the flexible resources

#### Four sources of flexibility ...

Grid infrastructure Dispatchable generation

Storage

Demand side integration

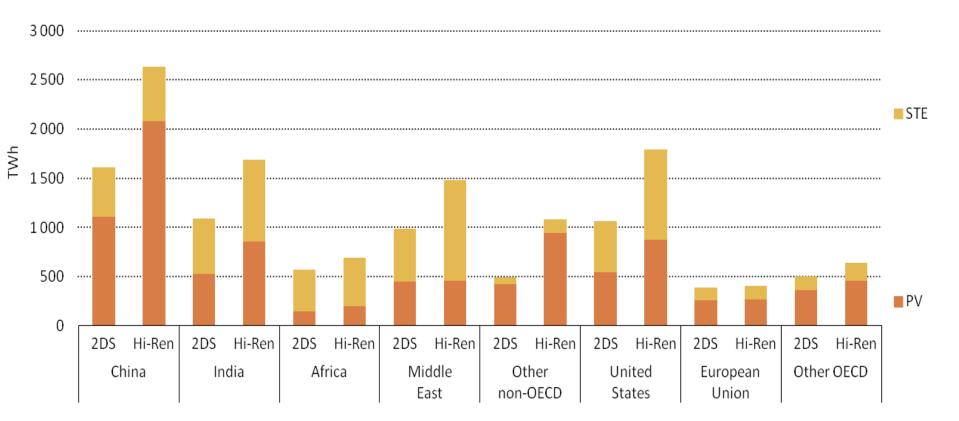

No one flexible resource meets all the needs.

ETP

#### Solar is more than PV

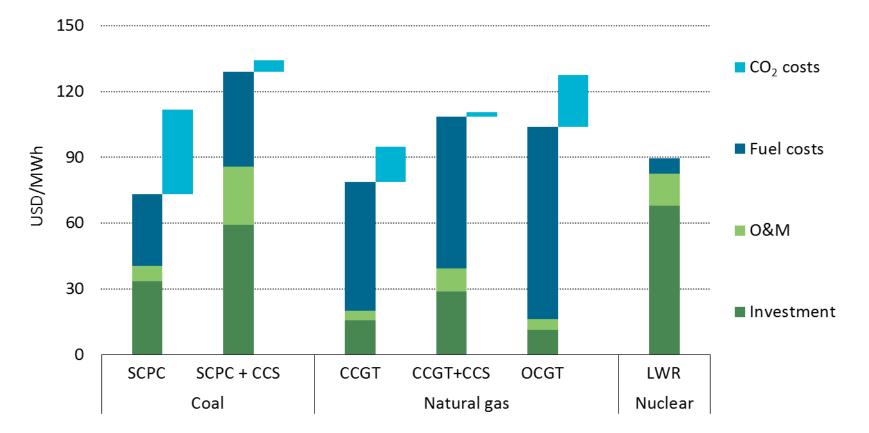

In areas with excellent DNI, including Africa, Chile, Mexico and the Middle East, STE eventually dominates

# Without CCS natural gas power generation is not carbon free

CCS for natural gas power generation is less expensive than CCS for coal.

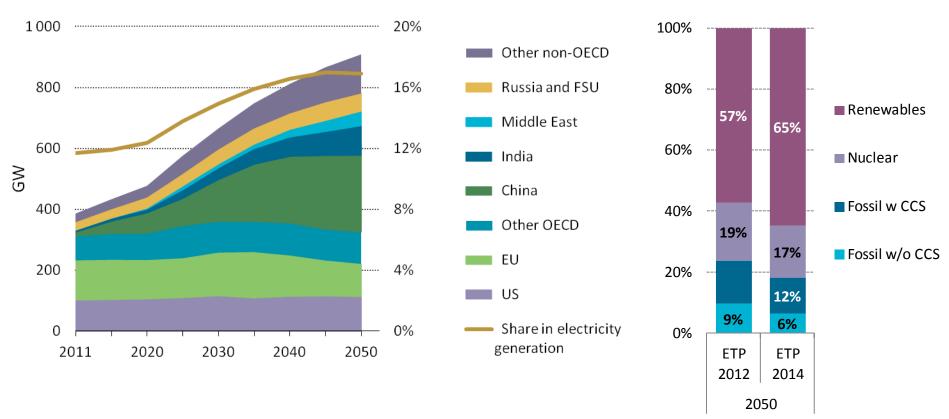

© OECD/IEA 2013

162

### Nuclear growth driven by non-OECD

Global nuclear capacity

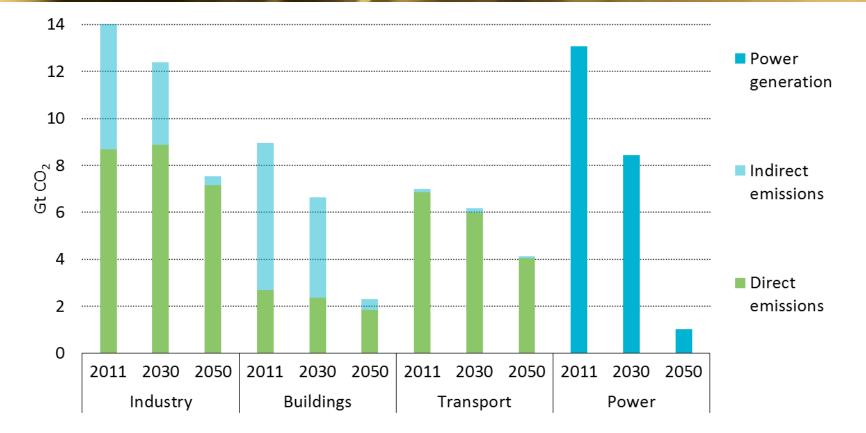

In 2011, around 80% of global nuclear capacity was located in the OECD. By 2050, 70% of nuclear capacity is outside of the OECD in the 2DS.

Generation mix

2.014

# Spillover effect of decarbonising electricity in the 2DS

2014

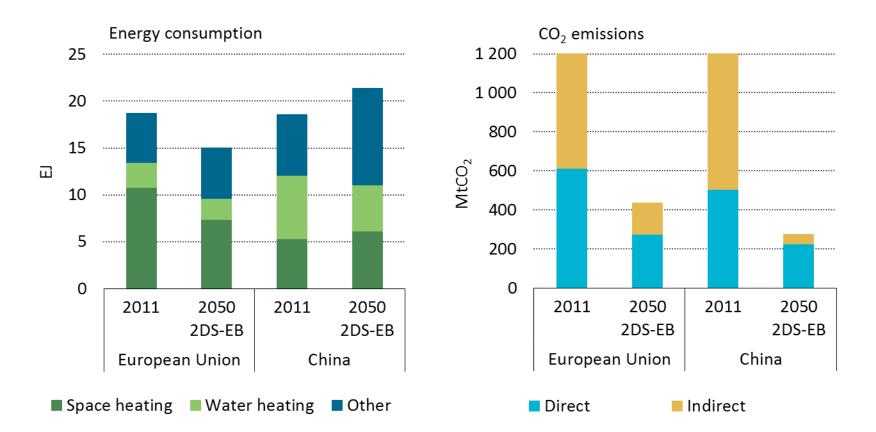

International Energy Agenc

© OECD/IEA 2013

iea

Electricity decarbonisation reduces emissions from sectors already electrified, without the need for further end-use investments.

# Building sector benefits most from decarbonisation of power generation

Increasing electricity use also helps to reduce natural gas demand in buildings

#### Financing low-carbon generation

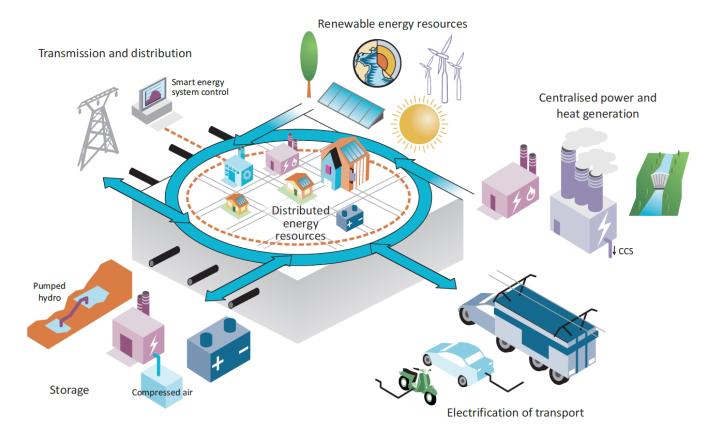

The upfront capital costs of low-carbon technologies are higher than gas fired generation – increasing the importance of financing

© OECD/IEA 2013

International Energy Agency

### Systems thinking and integration

ETP 2014

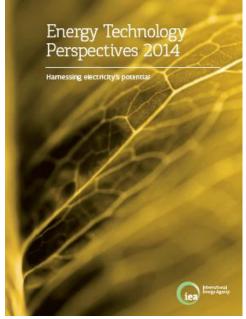

A sustainable electricity system is a smarter, multidirectional and integrated energy system that requires long-term planning for <u>services</u> delivery
